DETAILED ACTION

Page 2

Response to Amendment

- This Final office action is in response to Applicant's amendment filed February
 12, 2007. Claims 11-13 have been amended. Claim 14 has been added. Claims 2 7 and 11-14 are pending.
- 2. Applicant's arguments filed February 12, 2007 have been fully considered but they are not persuasive.

Claim Rejections - 35 USC § 103

- 3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 4. Claims 2, 3, 5-7 and 11-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fawcett et al (USPN 5,678,002), in view of in view of Phung et al (US 2002/0007237).

As per claim 11, Fawcett et al disclose a trouble management system capable of communicating, through a network, with a customer apparatus connected to a product (i.e., product support center, including product support services (PSS) client/server messaging system, column 3, lines 60-62), or a service person's apparatus, comprising: first receiving means for receiving, from said customer apparatus, trouble information of the product (i.e., communications path established between the customer and the PSS, column

Art Unit: 3623

6, lines 4-9, wherein a remote diagnostic agent 50 on customer computer 40 can execute a resident diagnostic application and query, receive and update information about an attached printer, column 10, lines 28-32); diagnosing means for diagnosing the product, in accordance with the response received by said second receiving means (i.e., diagnostic application, column 10, lines 28-30), when the determining means determines that the inquiry is necessary (i.e., execution of resident or downloaded diagnostic application, wherein the results indicate that no trouble exists, column 10, lines 30-32).

Fawcett et al does not explicitly disclose determining means for determining whether or not an inquiry is necessary, on the basis of the trouble information received by said receiving means; transmitting means for transmitting the inquiry item relating to the product to said customer apparatus, if said determining means determines that the inquiry is necessary; and second receiving means for receiving, from said customer apparatus, a response which is input to said customer apparatus on the basis of the inquiry item transmitted by said transmitting means. Phung et al a trouble tree diagnostic routine guides the user to identify possible repair checks and actions (i.e., determination and transmission of an inquiry, ¶ 0048), wherein the system consists of a symptoms search (i.e., inquiry) and a customized diagnostic (¶ 0049). In addition, Phung et al disclose a call routine invoked to get diagnostic data from the vehicle system (i.e., receiving, from said customer apparatus, a response, ¶ 0052). Both Fawcett and Phung are concerned with conducting

Art Unit: 3623

product diagnosis over an electronic network. Therefore it would have been obvious to one having ordinary skill in the art at the time the invention was made to include determining whether or not a check item is necessary, on the basis of the trouble information received by said receiving means; transmitting the check item relating to the product to said customer apparatus, if said determining means determines that the check item is necessary; and receiving, from said customer apparatus, a check result which is input to said customer apparatus on the basis of the check item transmitted in Fawcett et al, as seen in Phung et al, thus efficiently determining the cause and solution of a encountered problem, thereby making Fawcett et al more robust.

As per claim 2, Fawcett et al disclose analysis means for analyzing information about the trouble in the product (i.e., PSS 38 commands a remote diagnostic agent 50 on customer's computer 40 to execute a diagnostic application, column 10, lines 28-32); and search means for searching for the operation for resolving the trouble in the product on the basis of the result of said analysis (i.e., automatically sniff around customer's computer in order to gather diagnostic data and help troubleshoot, column 10, lines 44-47).

As per claim 3, Fawcett et al disclose analysis by said analysis means is performed on the side of a user using the product (i.e., PSS 38 commands a remote diagnostic agent 50 on customer's computer 40 to execute a diagnostic application, column 10, lines 28-32).

Art Unit: 3623

As per claim 5, Fawcett et al does not disclose management means for managing a guarantee period of the product, wherein said cost depends on the managed guarantee period. Phung et al discloses the product manufacturer absorbing all the costs related to troubleshooting and resoling failures covered by a warranty (¶ 0005). Both Fawcett and Phung are concerned with conducting product diagnosis over an electronic network, therefore it would have been obvious to one having ordinary skill in the art at the time the invention was made to include managing a guarantee period of the product (i.e., warranty), wherein said cost depends on the warranty in Fawcett, as seen in Phung, thereby determining when the customer does not have to incur diagnostic and troubleshooting costs, as seen in Phung. As a result, the customer service in Fawcett et al is improved, since the cost to the customer may be reduced.

As per claim 6, Fawcett et al disclose management means for managing information about specifications of the product (i.e., device manager diagnostic allows PSS engineer to retrieve the properties and characteristics of all hardware devices attached to computer, column 12, lines 48-50), wherein analysis by said analysis means depends on the managed information about the specifications (i.e., query a list of available devices and invoke device diagnostics, column 10, lines 35-36).

As per claim 7, Fawcett et al disclose storage means for storing contents of the operation actually performed to resolve the trouble in the product or results

Art Unit: 3623

of the operation (i.e., the diagnostic interpreter remains in memory on the PSS side, column 11, lines 20-23 and 28-31).

Claim 12 is rejected based upon the same rationale as the rejection of claim 11, since it is the method claim corresponding to the system claim.

Claim 13 is rejected based upon the same rationale as the rejection of claim 11, since it is the storage medium claim corresponding to the system claim.

As per claim 14, Fawcett et al disclose diagnosis possibility determining means for determining whether or not a diagnosis is possible (i.e., execution of resident or downloaded diagnostic application, wherein the results indicate that no trouble exists, column 10, lines 30-32, wherein diagnostic actions completed on the customer's computer are documented in a transaction log, column 11, lines 20-23); additional determination means for determining whether or not a further inquiry is necessary, if the diagnosis possibility determining means determines that the diagnosis is not possible (i.e., execution of resident or downloaded diagnostic application, wherein the results indicate that no trouble exists, column 10, lines 30-32, wherein diagnostic actions completed on the customer's computer are documented in a transaction log, column 11, lines 20-23); and additional transmission means for transmitting a further inquiry item to the customer apparatus, if the additional determination means determines that the further inquiry is necessary (i.e., the diagnostic interpreter's callback function parses the message, interprets the data and displays the result of the PSS engineer, column 9, lines 27-30, including the knowledge base diagnostic, column 14, lines 58-67).

Art Unit: 3623

5. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fawcett et al (USPN 5,678,002), in view of Skaaning et al (USPN 6,535,865).

As per claim 4, Fawcett et al does not explicitly disclose said notice means sends a notice of a cost or a time required for the operation. Skaaning et al disclose estimating the cost of actions as a combination of multiple factors, including time to perform the action (column 21, lines 1-5). Both Fawcett and Skaaning are concerned with effective troubleshooting via a customer computer, therefore it would have been obvious to one having ordinary skill in the art at the time the invention was made to include sending notice of a cost in Fawcett, as seen in Skaaning, in order to determine which is the optimal step to perform (see Skaaning, column 21, lines 1-3), thus improving the efficiency in Fawcett.

Response to Arguments

6. In the Remarks, Applicant argues that Fawcett et al, Phung et al and Skaaning et al fail to teach or suggest receiving trouble information from a customer apparatus to determine whether or not an inquiry to the customer apparatus is necessary and, if it is determined that the inquiry is necessary, transmitting the inquiry item to the customer apparatus. The Examiner respectfully disagrees and submits that Fawcett et al disclose a remote diagnostic agent 50 on customer computer 40 can execute a resident diagnostic application and query, receive and update information about an attached printer (column 10, lines 28-32), thus indeed receiving trouble information from a customer apparatus. Phung et al a trouble tree diagnostic routine guides the

Art Unit: 3623

user to identify possible repair checks and actions (i.e., determination and transmission of an inquiry, ¶ 0048), wherein the system consists of a symptoms search (i.e., inquiry) and a customized diagnostic (¶ 0049). In addition, Phung et al disclose a call routine invoked to get diagnostic data from the vehicle system (i.e., receiving, from said customer apparatus, a response, ¶ 0052). Moreover, Phung et al disclose a vehicle interface system (i.e., customer apparatus) that communicates with the vehicle system 400 (i.e., product) in figures 2A and 2B.

Applicant also argues that the trouble management system is not at the local or customer level, as seen in the cited references, but connected, via a network, to a customer apparatus connected to a product. The Examiner respectfully disagrees with Applicant's characterization of the references. Moreover, the Examiner submits that the recitation "communicating, through a network, with a customer apparatus connected to a product," has not been given patentable weight because the recitation occurs in the preamble. A preamble is generally not accorded any patentable weight where it merely recites the purpose of a process or the intended use of a structure, and where the body of the claim does not depend on the preamble for completeness but, instead, the process steps or structural limitations are able to stand alone. See *In re Hirao*, 535 F.2d 67, 190 USPQ 15 (CCPA 1976) and *Kropa v. Robie*, 187 F.2d 150, 152, 88 USPQ 478, 481 (CCPA 1951).

Conclusion

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Andre Boyce whose telephone number is (571) 272-6726. The examiner can normally be reached on 9:30-6pm M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tariq Hafiz can be reached on (571) 272-6729. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
